2 Evaluation rubric (30 marks)

Total 30 = 15 individual + 15 report. The individual marks are awarded per student at the demonstration + viva, so two members of one team may score differently. The report marks are a team score that the examiner may scale for clearly uneven contribution.

Part 1 — Individual evaluation (15 marks)

Scored per student at the live demonstration and viva.

Criterion (max)	Excellent — full marks	Satisfactory — about half	Weak — low / 0
Live demonstration & hands-on competence (10)	Runs the attack and defense live; drives the tools fluently; recovers from hiccups unaided.	Completes the demo with prompting or gaps; follows a script without full understanding.	Cannot make the demo run, or only one half (attack or defense) works.
Depth of understanding — viva (5)	Explains how the attack works, why the defense stops it, and the underlying concept; handles "what-if" follow-ups.	Explains the steps but not the mechanism; shaky on follow-ups.	Knows commands only; cannot explain what the tools do or why.

Part 2 — Report evaluation (15 marks)

Scored on the submitted team report (recommended 6–10 pages) and the scripts/configs used.

Criterion (max)	Excellent — full marks	Satisfactory — about half	Weak — low / 0
Problem definition & threat model (2)	Clear scope, assets, attacker, and what is at risk.	Vulnerability named but threat model thin.	Topic restated with no analysis.
Methodology & lab setup (3)	Reproducible: topology, tool versions, configs, and steps anyone could repeat.	Described but missing detail needed to reproduce.	Vague or absent.
Attack implementation & results (3)	Attack shown working with annotated evidence (captures, logs).	Attack shown but evidence weak or unexplained.	No working attack or no evidence.
Defense / mitigation & evaluation (3)	Defense implemented and proven by re-running the attack; before/after compared.	Defense described but effectiveness not convincingly shown.	Defense missing or untested.
Analysis & discussion (2)	Discusses why the defense works, its limits, false positives, and residual risk.	Some analysis, mostly descriptive.	None.
Report quality & reproducibility (2)	Well-structured and cited; the scripts/configs reproduce the results.	Readable but structural / citation gaps.	Poorly organised, uncited, or not reproducible.
